

The applicant argue that the newly presented claims (143-148, filed on 10/09/2008) has support from the specification (instructions configured to cause the processor to not recalibrate and/or update calibration of the data stream using a glucose concentration measured by the single point glucose monitor when the rate of change of the calibrated data stream is outside a physiologically feasible limit.) The examiner disagree because the section the applicant presented (shown below) has no support this limitation in the claim. The examiner communicate to the applicant that if this limitation was to examine later, there is going to be 112 1<sup>st</sup> rejection. The applicant try to cause interference with 11/334876 claim 14.

[0283] The processing circuit 109 of the on-skin sensor control unit 44 and/or an analyzer 162 of the receiver/display unit 46, 48 may determine when calibration data is needed and if the calibration data is acceptable. The on-skin sensor control unit 44 may optionally be configured to not allow calibration or to reject a calibration point if, for example, 1) a temperature reading from the temperature probe indicates a temperature that is not within a predetermined acceptable range (e.g., 30 to 42° C. or 32 to 40° C.) or that is changing rapidly (for example, 0.2° C./minute, 0.5° C./minute, or 0.7° C./minute or greater); 2) two or more working electrodes 58 provide uncalibrated signals that are not within a predetermined range (e.g., within 10% or 20%) of each other; 3) the rate of change of the uncalibrated signal is above a threshold rate (e.g., 0.25 mg/dL per minute or 0.5 mg/dL per minute or greater); 4) the uncalibrated signal exceeds a threshold maximum value (e.g., 5, 10, 20, or 40 nA) or is below a threshold minimum value (e.g., 0.05, 0.2, 0.5, or 1 nA); 5) the calibrated signal exceeds a threshold maximum value (e.g., a signal corresponding to an analyte concentration of 200 mg/dL, 250 mg/dL, or 300 mg/dL) or is below a threshold minimum value (e.g., a signal corresponding to an analyte concentration of 50 mg/dL, 65 mg/dL, or 80 mg/dL); and/or 6) an insufficient amount of time has elapsed since implantation (e.g., 10 minutes or less, 20 minutes or less, or 30 minutes or less).
